Stroke Metrics In golf, every hole has a **par**—an average number of strokes taken to get the ball in the hole

There are (almost always), three different **pars** on every course:

- par 3s
- par 4s
- par 5s

A shorthand to determine how a golfer performed across holes is to rate how many strokes *relative to par* they were (-1, -2, +1, +2, etc)

These numbers are given names:

- 0 = par
- -2 = eagle
- -1 = birdie
- +1 = bogey
- +2 = double bogey

I quantify these below:

```
stroke_metrics <- scores_sum |>
  dplyr::select(`doubles+`, bogies, pars, birdies)
head(stroke_metrics |>
  dplyr::arrange(desc(date)))
```
